Varieties no longer listed in the East/West region: Rhino, Vision, PR45D05 and Cash

On the 1-9 scales, high figures indicate that a variety shows the character to a high degree (e.g. high resistance).

There is a target plant population of 40 plants per square metre for RL trials.

Maximum seed rates are 70 seeds/sqm for hybrids and 100 seeds/sqm for conventional varieties and may be below these levels if conditions permit.

Glucosinolate contents are taken from the National List trials data.

Yield controls for current table were Excalibur and Vision (both no longer in trial) and PR46W21 and DK Cabernet designated C above.

[ ] = limited data

Sp = specific recommendation

UK = recommended for both the East/West and North regions

\* = variety no longer in trial in region

Conv = conventional open-pollinated variety

E/W = recommended for the East/West region

P1 = first year of recommendation

RH = restored hybrid

P2 = second year of recommendation

\$ = Mentor and Cracker are recommended for growing on land infected with common strains of clubroot. They may, however, be infected by some strains and infections have been reported in some fields.

£ High levels of disease have been observed in Scotland on Cracker and further tests are being undertaken. Growers in Scotland should bear this in mind when considering fungicide inputs.

# = Semi-dwarf varieties that are believed to carry the *Bzh* dwarfing gene in the heterozygous state but this has not been verified in RL tests

& = Clearfield® variety, with tolerance to specific imidazolinone herbicides

LSD = least significant difference

Average LSD (5%): varieties that are more than one LSD apart are significantly different at the 5% confidence level.
